

Morning Review

Good morning, dear students and partners! This is James Wilson. The CPI data has been released, so what kind of impact will it have on the market? Let's dive into today's investment analysis.

The August CPI inflation data rose 2.5% year-over-year, matching the expected value of 2.5%, with the previous value at 2.9%.

Core CPI increased by 3.2% year-over-year, in line with both the forecast and the previous value. The month-over-month increase was 0.3%, slightly higher than the expected and previous value of 0.2%.

After the data release, the U.S. dollar index strengthened quickly, and U.S. stock futures saw a short-term decline. Meanwhile, the yield on 10-year U.S. Treasury bonds slightly increased, and short-term Treasury yields rose by about 7 basis points. This further narrowed the yield spread between short-term and long-term bonds, with the spread briefly touching the day's low.

The CPI data indicates a bearish outlook for U.S. stocks.

A bearish outlook for U.S. stock market—can we trade at the low if a dip occurs?

First of all, my stance is clear: I don't never fear a market decline. Often, in times of extreme fear, opportunities arise, and I've frequently encouraged confidence in such moments. However, this time is different. Even if the market falls, my answer remains no. Why? Because with the latest CPI data released, Wall Street has quickly adjusted its expectations for a major Fed rate cut in September. The market now sees almost no chance of a 50 basis point cut next week.

In fact, the September rate cut has already been heavily speculated on, with strong signals starting as early as the Jackson Hole Symposium. But now, the enthusiasm for a rate cut has been exhausted in advance, and the optimism investors felt will soon turn into disappointment.

It's not the right time to enter at the low—there will be even lower points ahead.

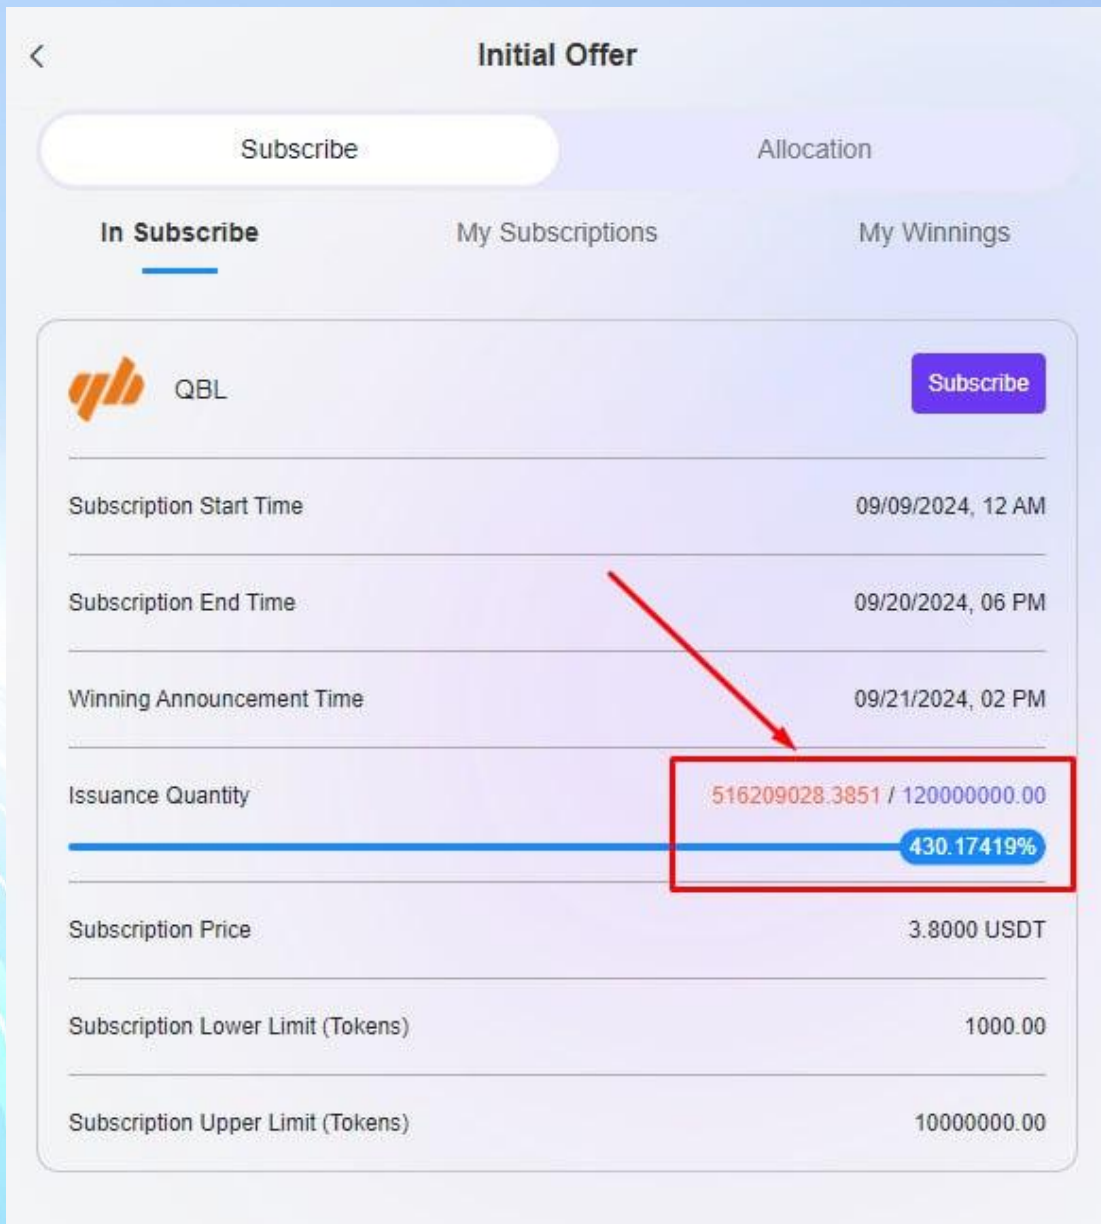

Regarding the market's reaction after a rate cut, will increased liquidity lead to buying activity?

Indeed, increased liquidity typically brings opportunities for market rallies. If a modest rate cut disappoints investors, that disappointment may eventually be absorbed, and the market could gradually rebound. As I often say, "When all the good news

is priced in, it becomes bearish; when all the bad news is priced in, it becomes bullish." Once the effects of the rate cut are fully digested, funds could re-enter the market and push prices higher. However, the real question is: Has all the bad news been priced in? Is market uncertainty gone?

The U.S. presidential election is just around the corner! This is undeniably the biggest uncertainty for the market right now. It's not just a concern for U.S. stocks—it's a variable with enormous implications for the entire global financial market. Coupling this with the current technical outlook of the U.S. indices, whether we look at the news, fundamentals, or technicals, one clear conclusion emerges: the bull market in 2024 is over.

Let's take a look at the QBL project we're currently investing in—the progress bar has surpassed 430%! This is absolutely insane!

As you know, once the progress bar exceeds 100%, it signifies zero

FB Finance Institute - 15th Session

risk. The more funds that flow in due to the project's rising popularity, the larger the profit potential becomes. This is the inevitable outcome of market demand—there's no doubt about it. And the most unbelievable part? It's only the third day, and the QBL subscription progress has already exceeded 430%! What does this tell us? Not only does it show the market's massive interest in QBL, but it also suggests that more investors are likely to jump in, pushing the momentum even further!

As we move forward, the progress bar might accelerate even faster. The speed of QBL's progress has already far exceeded my expectations, and it's performing much better than BCX during the same period. Therefore, I must adjust my profit projections for QBL to ensure you're up to date and can make the necessary preparations.

Based on the current enthusiasm and increasing participants, I now estimate that QBL could bring us returns of 12 to 14 times on the listing day! If you've secured an allocation of \$100,000, this could potentially bring a return of up to \$1.4 million; and if you've

FB Finance Institute - 15th Session

been allocated \$1 million, you could see returns as high as \$14 million!

As the QBL project continues to gain momentum, we are walking on a wide, open road toward financial freedom and a new life!

From stocks to options, to crypto contracts, and now IDO projects, we've seen countless opportunities and challenges along the way. But right now, the QBL project presents us with an unprecedented opportunity. This isn't just an investment—it's a bridge to change your life and realize your dreams, leading us toward a future filled with freedom, abundance, and endless possibilities!

Let me summarize it for you once more: 12-14 times of risk-free profit! A 10 day investment cycle! This is a once in a lifetime opportunity, offering the chance for extraordinary wealth growth in just two short weeks. In the future, you won't be bound by work—you'll be free to control your time and enjoy every moment of life.

What will you do then? Perhaps you'll take your family on the trip you've always dreamed of, to the pristine beaches of Hawaii or the charming, historic towns of Europe, savoring a long vacation. You won't have to worry about any expenses because QBL has already secured your financial future. Imagine waking up to the sunlight streaming into your newly purchased vacation home, the scent of coffee filling the air, and a gentle sea breeze brushing past. At that moment, you'll only wish for time to slow down, so you can savor the peace and tranquility even longer.

If it weren't for the rapid rise of the QBL progress bar causing me some concern, I'd be congratulating everyone ahead of time. Some of you might be wondering, "Isn't it a good thing that the progress bar is rising so quickly?"

Now, let me break down the logic for you. The success of the BCX project has proven that we are currently in a golden period for IDO projects. The arrival of the QBL project, without a doubt, is drawing even more attention than BCX. Maybe you were indifferent to BCX at first and missed out on the opportunity. But

FB Finance Institute - 15th Session

seeing its success, you might now feel a bit of regret. This time, with the QBL project, you have a second chance, and you're determined not to miss it. You're thinking this way, I'm thinking this way, and in fact, every investor—from individual, experienced players to powerful institutional investors—will be thinking the same.

So the logic becomes crystal clear. The success of BCX has validated the potential of QBL, and the rapid growth of the QBL progress bar is the clearest indication of this. As a result, the number of participants in QBL will be significantly higher than in BCX. Not only will retail investors rush in, but institutional investors will also be eager to join. What will this lead to?

The QBL project is revealing an extreme duality: on one side lies the promise of immense wealth, and on the other, the brutal reality of fierce competition! QBL is destined to bring huge returns to some, but many will inevitably face disappointment as the allocation rates fall far below their expectations.

The question now is no longer whether QBL will rise 12 times or 14 times—that's almost a given! The real issue is that everyone has recognized this historic opportunity. There's only one QBL "cake," and as more people rush in, the price will skyrocket far beyond what you can imagine, but at the same time, the difficulty of securing your share will multiply.

Do you see it now? With more institutional investors and top-tier individual investors pouring in, the progress bar for QBL will continue to soar, and the momentum will only grow stronger!

Everyone is scrambling for this "cake." Those who secure their piece will make a fortune, but those who miss out will be left with far less than expected. I'm sure you understand this logic—perhaps even more clearly than I do. So, how do we respond?

Expanding Our Advantage

1. If you didn't execute early on in the QBL project—didn't use an

FB Finance Institute - 15th Session

"alarm clock strategy" to secure the time advantage at the beginning—then you've entered a situation of extreme difficulty. What you must do now is push beyond the norm, increase your investment! Use your financial advantage to reclaim the time advantage you missed!

2. If you did set that "alarm clock" and entered early, then congratulations—you've secured a time advantage! But don't rest easy. To ensure that the influx of high-quality investors and institutions doesn't dilute this advantage, we must increase our investment even further, amplifying our lead and ensuring that we stay ahead in the "cake-cutting" game.

The QBL progress bar is both hope and challenge. On one side, like an angel, it tells us the more the bar grows, the higher the profits—our returns grow directly proportional to the bar's increase. But on the other side, it's like a devil—each step the progress bar takes upward dilutes the allocation rate. As more people and capital flood in, although the cake gets bigger, the slice each person gets might be far smaller than you expected.

For instance, if the QBL progress bar reaches 1,200%, the funds that are allocated will enjoy 12x returns. However, this also means that securing an allocation becomes much harder, with the average allocation rate rising to 12 times the initial difficulty. The more funds oversubscribe, the lower your chance of securing a significant allocation.

Therefore, having a time advantage is not enough. We must increase our investment, consolidate our leading position, and capture a larger share to maximize our returns! Is there a better way?

From the current state of the QBL progress bar, it's clear that top-tier investors and institutional capital are asserting their absolute advantage! In this fierce competition, ask yourself: Do you consider yourself a top-tier investor at this moment? If we don't take action, we risk being left far behind.

So, what should we do now? We must rely on the power of our institute and harness our collective strength! This is the moment to demonstrate the spirit of united effort. Only by working

FB Finance Institute - 15th Session

together can we secure the green channel. At this moment, retreat is not an option—we must give it our all and invest everything we have!

Mr. B has already made his choice—he has decided to sell his vineyard in Europe. We may not fully grasp the personal significance of that vineyard to him, but one thing is clear: it's something he holds dear. The reason he's willing to let it go is that he sees a far greater future ahead. Trading one vineyard to acquire more vineyards—that's his strategy! He has shown his commitment through action, and now it's our turn!

Friends, you will soon see the next step I'm about to take. I urge everyone to act immediately—our goal is singular: secure the green channel!

Closing Commentary (α & β Strategy)

Hey, my market warriors and freedom chasers, how's your afternoon going? I hope you're all energized and ready to take on the challenges ahead!

“Simplifying investments, enhancing the quality of life of countless families”—that’s our motto. I’m Richard Bill, carrying the torch of Prof. Clark’s legacy, fueled by the pioneering spirit of AI 4.0, and driven by an unstoppable determination to become the next Chief Practical Instructor. Your unwavering support

FB Finance Institute - 15th Session

means the world to me!

Folks, today marks 9/11, a day we must never forget—remembering those who lost their lives during one of the darkest moments in history. We must also remember the pain endured by those who lost their family and loved ones. The shadows of that suffering have followed me for years, but then I came across a speech by Obama that truly lifted my spirits. In his speech, he said:

“At the same time, we have recommitted ourselves to living our values at home. As a nation of immigrants, the United States welcomes people from every country and culture. These newest Americans—like all the innocent victims we lost ten years ago—remind us that despite any differences of race or ethnicity, background or belief, we are all bound together by the common hope that we can make the world a better place for this and future generations. That must be the legacy of those we have lost.”

This quote deeply moved me. No matter where we come from or what our backgrounds are, we all share a common goal—creating a better future. It's this belief, like an unstoppable force, that drives us to face every challenge head on in life and in our investments.

As Nietzsche once said, “That which does not kill me makes me stronger.” The meaning of life is not about reaching a final destination; it's about breaking through barriers and surpassing ourselves, time and again. “Man is a bridge, not a goal,” and I hope each one of you becomes that “Superman”!

Yesterday, we broke down the signal behind the inverted yield curve and clarified the "risk free" retreat and attack strategy for the upcoming recession. We also unveiled the tremendous commercial value and rarity of QBL compared to BCX in its IDO. At the same time, we shared the 7 key strategies to help you dominate this market. This is a moment to redefine what it means to invest in top tier IDOs, a once in a lifetime opportunity to stand at the pinnacle of future wealth!

FB Finance Institute - 15th Session

And now, the latest CPI annual rate data has been released—how will it influence next week’s rate cut decision? A market storm is about to hit! QBL’s IDO progress bar has exploded, but what hidden “mysteries” lie behind this opportunity? The market is like a battlefield, and unity is our greatest weapon. When we stand together, we’re not just crossing the bridge—we’re conquering it, surpassing it, and standing on the peak, gazing toward the future!

Alright, folks! Let's quickly recap the first presidential debate: as soon as the candidates shook hands—boom—the tension exploded! Economic policy, immigration, abortion rights, international conflicts, every crucial issue was laid bare. Both

FB Finance Institute - 15th Session

sides pulled out all the stops to win over voters. As the competition heats up and the polls swing wildly, the market is also going crazy and unpredictable. But you know the drill: in the chaos of the market, smart investors always find the calm in the storm, locking in the safest opportunities.

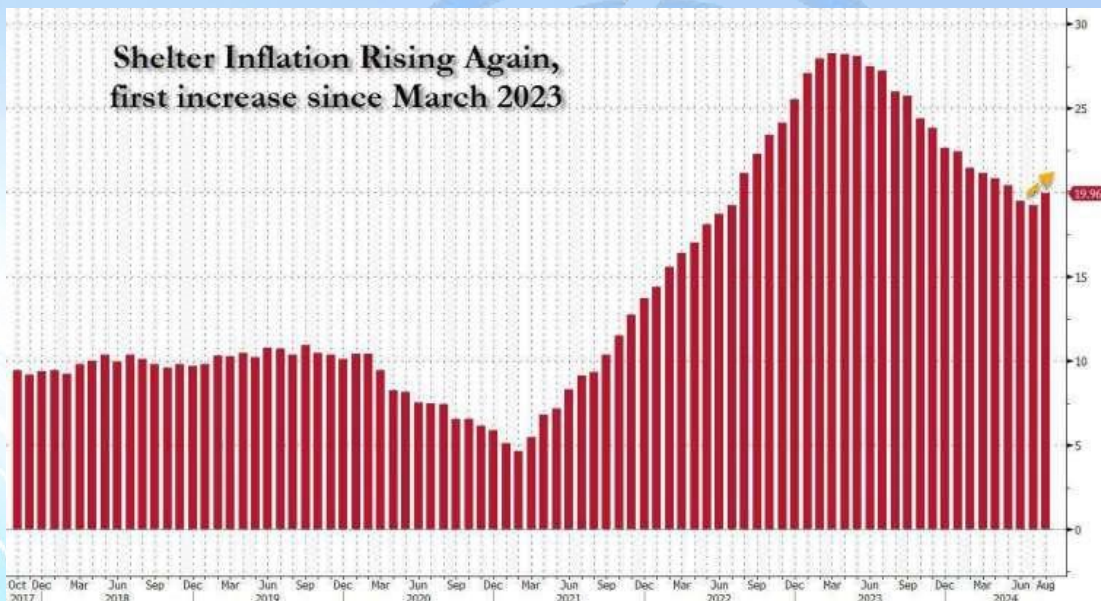

What really caught my attention was this question: "Are Americans better off than they were four years ago?" This isn't just a challenge for the candidates and the country, it's a question we should all ask ourselves! Look at how much our institute has transformed over the past four years! Under the leadership of my mentor, Prof. Clark, we not only rode the AI wave—we mastered it. AI 4.0 system? Yep, we built that! And before it's even officially launched, we've already been crushing it—navigating the bear market, crushing opportunities, rewriting investment history again and again. Are you feeling it?

So let me ask y'all—how many times over have your returns multiplied in the last four years? In our recent sessions, how many of you have seen your profits shoot off like a rocket? Now,

FB Finance Institute - 15th Session

back to the present—what’s the most stable and effective profit plan right now? Have you made sure you’re fully invested, or are you still on the sidelines? This is the stage for the strong—are you here to dominate the market or just to watch from the stands?

Why is the CPI data so important? Simply put, it directly affects the Fed’s interest rate decisions, which in turn steer the bull and bear cycles in major investment markets.

Today’s data? To break it down: overall inflation for August slowed to its lowest pace in three and a half years. However, core inflation saw its largest increase in four months, mainly driven by

rising housing and travel costs. This pretty much sets the tone for the Fed to cut rates by 25 basis points next week. As for a bigger cut, like 50 basis points? Ain't no way. So, what kind of impact can we expect from this?

Let's break it down again, folks:

~ The Fed isn't going for aggressive rate cuts, which means the economy isn't completely trashed yet. Today, we saw some buying interest come back into the market, signaling long term investors are slowly returning.

~ Short term impact? The dollar's holding its ground, but stock indexes aren't as lucky. We expect them to hit resistance levels and then fall back.

FB Finance Institute - 15th Session

~ Mid term? Sideways movement and some shaky ground. The recession is the “new normal” for now, and turning things around will take time.

What’s next?

~ Short term: Investors will sell into any strength. Stock indexes might see a brief spike, but they’ll eventually pull back.

~ By year end: With a mix of complex factors, stock indexes will likely see a deeper dip as volatility kicks in.

~ Next year: As the Fed continues to cut rates, the economy may begin to recover, and stock indexes will gradually gain strength.

Simple enough? Right now, we’re in the most uncertain period—but that’s also when smart hedging and grabbing risk free investment opportunities pays off! The market may be chaotic, but that doesn’t stop us from winning big!

Alright, folks, let's dive into today's main topic: unlocking the magic behind top tier IDO investments. Here's what we're

dealing with:

~ QBL's IDO progress has already surged past 440%, meaning the opening price will exceed \$16.72.

~ It's only been 3 days, with 9 more to go. Conservatively, the progress bar is expected to hit 1200%, meaning those who get in at this stage could see returns surpassing 12x on their original tokens.

~ As more high caliber investors come in, the post launch profit expectations will only get stronger!

As the progress bar skyrockets, so does the competition. What does this mean for us? What challenges lie ahead, and how can we maximize our returns? Let's break down the mysteries of IDO allocation ratios and how they directly impact your profits:

~ Why participating in an IDO guarantees you a certain percentage of the allocation.

~ The fundamental relationship between the progress bar, risk, and allocation percentages.

- ~ The secret connection between the progress bar, opening price, and allocation ratios.
- ~ Why QBL's actual allocation percentage might be far below the average allocation.
- ~ And most importantly—what actions you need to take to ensure the best possible outcome.

Pay attention: understanding these concepts is crucial. They could mean the difference between decent returns and life changing profits!

Why is it guaranteed that you'll get a piece of the pie when participating in an IDO?

Let's break it down by comparing it to a traditional stock IPO—it'll make the difference crystal clear:

In the stock market, an IPO is like a VIP club. If you're not a big shot investor or an institution, good luck! Even if you apply, actually getting shares is like trying to win the lottery. The

underwriters call the shots, and shares usually go to their biggest clients. For regular folks? Lmao, they're pretty much rolling the dice, and most walk away empty handed, maybe with a small consolation prize.

But in the crypto world, things are different! The IDO process is decentralized and fully handled by smart contracts. No human interference, no favoritism—every participant is guaranteed to receive tokens! The only thing that varies is how big your slice of the pie is, and that depends entirely on the amount you invest and where the progress bar stands. The more you put in, the bigger your allocation. The progress bar serves as a transparent, straightforward tool, showing everyone how the allocation is happening.

So, unlike an IPO where you're just hoping for a miracle, in an IDO, everyone has a fair shot—allocation is 100% guaranteed, and your share is based on your contribution. There's no rolling the dice here, only solid, predictable outcomes!

What's the basic relationship between the progress bar, risk, and allocation ratio? What's the secret behind the progress bar, opening price, and allocation ratio?

Here's what we know: once the progress bar exceeds 100%, the risk vanishes. The progress bar directly determines the opening price, and the simplest way to understand it is: progress bar percentage * issue price = opening price.

Now, here's where it gets more interesting—how does the progress bar influence your allocation ratio?

This is where things become more complex because the allocation ratio operates inversely to the subscription progress bar. The higher the progress bar, the smaller the allocation you receive.

Let me explain this through three gripping scenarios:

Scenario 1: Subscription ends, and the progress bar doesn't exceed 100%.

If it stops at 50%, congratulations—you'll receive a 100% allocation. Every dollar you invested will convert into QBL tokens. But beware, as the opening price may drop to \$1.9 ($3.8 * 0.5$), meaning you'll face a 50% loss right off the bat. This is why I always emphasize that once the progress bar surpasses 100%, you've entered the safe zone—zero risk and ready to soar.

Scenario 2: Subscription ends with the progress bar at exactly 100%.

Your allocation remains at 100%, meaning every dollar you contribute will result in QBL tokens. The opening price will be around \$3.8, and if you sell at that price, you'll break even. Whether the price rises after the launch? That will depend on the market's enthusiasm.

Scenario 3: Subscription ends with the progress bar exceeding 100%.

In this case, your allocation will be below 100%, introducing the

concept of "theoretical average allocation ratio"—the baseline data on how the "spoils" are distributed among participants. When the progress bar reaches 500%, 1000%, or 2000%, the theoretical average allocation ratio will drop to 20%, 10%, and 5%, respectively.

To sum up: the progress bar is directly proportional to the opening price, but inversely proportional to the allocation ratio—the higher the progress bar, the lower your allocation ratio.

Why Might QBL's Actual Allocation Ratio Be Much Lower Than the Average Allocation Ratio?

As QBL's subscription progress bar surges, we need to understand its implications for our investment strategy. Let's break it down into two core concepts: theoretical average allocation ratio and actual allocation ratio.

~ Theoretical allocation ratio is straightforward: divide 100 by the progress bar percentage.

For example, if the final progress bar reaches 2000%, the

theoretical allocation ratio would be $(100/2000) * 100\% = 5\%$.

~ Actual allocation ratio refers to the portion of tokens each participant truly receives.

Here's the key: QBL, with its higher entry threshold compared to BCX, is drawing in a crowd of high net worth investors. These investors have substantial capital, which means their actual allocation will be higher than the theoretical average, leaving smaller investors with less than expected.

The problem is: QBL's IDO still has over 9 days left. As the progress bar continues to climb, more big players will jump in to cut the pie, and the final progress bar could easily surpass 2000%. If that happens, many participants might see their actual allocation drop below 5%, and possibly as low as 3%, 2%, or even 1%!

Conclusion? The higher the progress bar, the smaller your actual allocation becomes, especially for smaller investors.

Picture this: you're stuck with less than 3% of the allocation, while others walk away with 100%. Are you okay with that? Same project, same effort, but your return is several times smaller! This isn't just missing out—it's watching a life changing opportunity slip right through your fingers.

The most important question—how do you ensure the best outcome?

The answer is clear: execute the 6 key techniques we shared yesterday, hit them with the 7th combo punch, and most importantly—secure that green VIP channel! That is your golden ticket to a 100% allocation.

Today, we must truly understand the power of unity! Unite around my mentor, Prof. Clark, and give it everything we've got. I believe with certainty that the "Superman" status belongs to us! We will no longer be passive spectators but the ones in control, cutting the cake.

Everyone's contribution matters. This isn't just about individual

FB Finance Institute - 15th Session

success—it's about the greatness of our collective. We're not just rewriting personal stories but reshaping the future of our entire team!

Alright, folks, that wraps up today's session, but before we call it a day, let's hit those key takeaways hard:

~ With the latest CPI data in hand, we've mapped out a clear and precise forecast for short, mid, and long term index movements. Our strategy? Locked in, calculated, and ready to strike or defend with precision!

~ Compared to IPOs, IDOs bring unmatched transparency, fairness, scarcity, and massive profit potential—this isn't just talk, it's the reality.

~ We broke it down with three scenarios: when the progress bar crosses 100%, the project is risk free; the higher the bar climbs, the higher the opening price—but the smaller your allocation. It's a tactical game of precision!

~ As the big money players pour in and the subscription period extends, small investors face a harsh reality—their actual allocations could be painfully small, while those who secure the green VIP channel will rake in profits 10, 20, or even 30 times larger!

~ Conclusion? We must secure that green VIP super channel, and I have no doubt we will. No excuses, only victory!

On this "special day," with the QBL IDO progress bar skyrocketing, we're facing real challenges. This is the moment to fully embrace the mindset: "That which does not kill me makes me stronger!"

The strength of our team is unstoppable!

Tomorrow? I'll take you deep into the secrets of daily allocation rates, ensuring we dominate and claim absolute victory.

Charge ahead, seize the future, and let's write a legendary story—"our" legendary story!
